(54) **GLUCOSE DEHYDROGENASE**

(57) Modified water-soluble glucose dehydrogenase having pyrrolo-quinoline quinone as a coenzyme are provided wherein at least one amino acid residue is

replaced by another amino acid residue in a specific region. Modified water-soluble PQQGDHs of the present invention have improved thermal stability.

EP 1 167 519 A1

Description**TECHNICAL FIELD**

5 [0001] The present invention relates to the preparation of glucose dehydrogenases having pyrrolo-quinoline quinone as a coenzyme (PQQGDH) and their use for glucose assays.

BACKGROUND ART

10 [0002] Blood glucose is an important marker for diabetes. In the fermentative production using microorganisms, glucose levels are assayed for monitoring the process. Conventional glucose assays were based on enzymatic methods using a glucose oxidase (GOD) or glucose-6-phosphate dehydrogenase (G6PDH). However, GOD-based assays required addition of a catalase or peroxidase to the assay system in order to quantitate the hydrogen peroxide generated by glucose oxidation reaction. G6PDHs have been used for spectrophotometric glucose assays, in which case a coenzyme NAD(P) had to be added to the reaction system.

15 [0003] An object of the present invention is to provide a modified water-soluble PQQGDH with improved thermal stability.

DISCLOSURE OF THE INVENTION

20 [0004] We found that PQQGDHs with high stability are useful as novel enzymes alternative to the enzymes that have been used for enzymatic glucose assays. PQQGDHs are useful as recognition elements of glucose sensors because they have high oxidation activity for glucose and they are coenzyme-bound enzymes that require no oxygen as an electron acceptor.

25 [0005] PQQGDHs catalyze the reaction in which glucose is oxidized to produce gluconolactone. PQQGDHs include membrane-bound enzymes and water-soluble enzymes. Membrane-bound PQQGDHs are single peptide proteins having a molecular weight of about 87 kDa and widely found in various gram-negative bacteria. Water-soluble PQQGDHs have been identified in several strains of *Acinetobacter calcoaceticus* (Biosci. Biotech. Biochem. (1995), 59(8), 1548-1555), and their structural genes were cloned to show the amino acid sequences (Mol. Gen. Genet. (1989), 217: 430-436). The water-soluble PQQGDH derived from *A. calcoaceticus* is a homodimer having a molecular weight of about 50 kDa.

30 [0006] Recently, a Dutch group made an X-ray crystal structure analysis of the water-soluble PQQGDH to show the higher-order structure of the enzyme (J. Mol. Biol., 289, 319-333 (1999)). The crystal structure of the apo form of the soluble quinoprotein glucose dehydrogenase from *Acinetobacter calcoaceticus* reveals a novel internal conserved sequence repeat; A. Oubrie et al., The EMBO Journal, 18(19) 5187-5194 (1999). Structure and mechanism of soluble quinoprotein glucose dehydrogenase, A. Oubrie et al., PNAS, 96(21), 11787-11791 (1999). Active-site structure of the soluble quinoprotein glucose dehydrogenase complexed with methylhydrazine; A covalent cofactor-inhibitor complex, A. Oubrie et al.). These papers showed that the water-soluble PQQGDH is a β -propeller protein composed of six W-motifs (Fig. 7).

35 [0007] As a result of careful studies to develop a modified PQQGDH that can be applied to clinical tests or food analyses by improving the conventional water-soluble PQQGDH to increase the thermal stability, we succeeded in obtaining an enzyme with very high stability by introducing an amino acid change into a specific region of the water-soluble PQQGDH.

40 [0008] Accordingly, the present invention provides a modified glucose dehydrogenase having pyrrolo-quinoline quinone as a coenzyme wherein an amino acid residue corresponding to serine 231 or glutamine 209 or glutamate 210 or aspartate 420 or alanine 421 in the water-soluble PQQGDH derived from *Acinetobacter calcoaceticus* (hereinafter also referred to as the wild-type PQQGDH) is replaced by another amino acid residue. As used herein, the "modified glucose dehydrogenase" means a glucose dehydrogenase wherein at least one amino acid residue in a naturally occurring glucose dehydrogenase is replaced by another amino acid residue. The amino acid numbering herein starts from the initiator methionine as the +1 position.

45 [0009] The present invention also provides a modified glucose dehydrogenase having pyrrolo-quinoline quinone as a coenzyme wherein at least one amino acid residue is replaced by another amino acid residue in one or more regions selected from the group consisting of the regions defined by residues 48-53, 60-62, 69-71, 79-82, 91-101, 110-115, 127-135, 147-150, 161-169, 177-179, 186-221, 227-244, 250-255, 261-263, 271-275, 282-343, 349-377, 382-393, 400-403, 412-421, 427-432, 438-441 and 449-468 in the amino acid sequence shown as SEQ ID NO: 1, characterized in that it has higher thermal stability than that of the water-soluble PQQGDH derived from *Acinetobacter calcoaceticus*. Preferably, the modified PQQGDH of the present invention has a residual activity that is higher than the residual activity of the wild-type PQQGDH by 10% or more, more preferably 20% or more, still more preferably 30% or more after heat

treatment at 50°C for 10 minutes. Preferably, the modified PQQGDH of the present invention has a heat inactivation half-life that is longer than the heat inactivation half-life of the wild-type PQQGDH by 5 minutes or more, more preferably 15 minutes or more at 55°C. In especially preferred modified PQQGDHs of the present invention, at least one amino acid residue is replaced by another amino acid residue in the region defined by residues 227-244, 186-221 or 412-421 in the amino acid sequence shown as SEQ ID NO: 1. In still more preferred modified PQQGDHs of the present invention, serine 231 is replaced by an amino acid residue selected from the group consisting of lysine, asparagine, aspartate, histidine, methionine, leucine and cysteine, or glutamine 209 is replaced by lysine, or glutamate 210 is replaced by lysine, or aspartate 420 is replaced by lysine, or alanine 421 is replaced by aspartate in the amino acid sequence shown as SEQ ID NO: 1.

10 [0010] In another aspect, modified PQQGDHs of the present invention comprise the sequence:

Asn Leu Asp Gly Xaa231 Ile Pro Lys Asp Asn Pro Ser Phe Asn
 15 Gly Val Val Ser

wherein Xaa231 represents a natural amino acid residue other than Ser; or the sequence:

20 Gly Asp Gln Gly Arg Asn Gln Leu Ala Tyr Leu Phe Leu Pro Asn
 25 Gln Ala Gln His Thr Pro Thr Gln Xaa209 Xaa210 Leu Asn Gly
 Lys Asp Tyr His Thr Tyr Met Gly

30 wherein Xaa209 and Xaa210 represent any natural amino acid residue, provided that when Xaa209 represents Gln, Xaa210 does not represent Glu; or the sequence:

Pro Thr Tyr Ser Thr Thr Tyr Asp Xaa420 Xaa421

35 wherein Xaa420 and Xaa421 represent any natural amino acid residue, provided that when Xaa420 represents Asp, Xaa421 does not represent Ala.

[0011] The present invention also provides a gene encoding any of the modified glucose dehydrogenases described above, a vector containing said gene and a transformant containing said gene, as well as a glucose assay kit and a glucose sensor comprising a modified glucose dehydrogenase of the present invention.

[0012] Enzyme proteins of modified PQQGDHs of the present invention have high thermal stability and high oxidation activity for glucose so that they can be applied to highly sensitive and highly selective glucose assays. Especially, they are expected to provide the advantages that the enzymes can be produced at high yield with less inactivation during preparation/purification; the enzymes can be easily stored because of their high stability in solutions; the enzymes can be used to prepare an assay kit or an enzyme sensor with less inactivation; and the assay kit or enzyme sensor prepared with the enzymes has excellent storage properties because of the high thermal stability.

BRIEF DESCRIPTION OF THE DRAWINGS

50 [0013]

- FIG. 1 shows the structure of the plasmid pGB2 used in the present invention.
- FIG. 2 shows a scheme for preparing a mutant gene encoding a modified enzyme of the present invention.
- FIG. 3 shows thermal stability of a modified enzyme of the present invention.
- FIG. 4 shows substrate specificities of modified enzymes of the present invention.
- FIG. 5 shows a glucose assay using a modified PQQGDH of the present invention.
- FIG. 6 shows a calibration curve of an enzyme sensor using a modified PQQGDH of the present invention.
- FIG. 7 shows the topology of a water-soluble GDH (Oubrie et al., Fig. 4).

THE MOST PREFERRED EMBODIMENTS OF THE INVENTION

Structure of modified POOGDHs

[0014] We introduced random mutations into the coding region of the gene encoding the water-soluble POOGDH by error-prone PCR to construct a library of water-soluble POOGDHs carrying amino acid changes. These genes were transformed into *E. coli* and screened for the residual activity of the POOGDHs after heat treatment to give a number of clones that express POOGDHs with improved thermal stability.

[0015] Analysis of the nucleotide sequence of one of these clones showed that Ser 231 had been changed to Cys.

10 When this amino acid residue was replaced by various other amino acid residues, mutant enzymes with higher thermal stability than that of the wild type water-soluble POOGDHs were obtained in every case.

[0016] The water-soluble POOGDH has the structure of a β -propeller protein composed of six W-motifs. In the present invention, it was found that thermal stability is improved by replacing Ser 231 in the loop region defined by residues 227-244 by another amino acid residue. Then, site-specific mutations were introduced into other loop regions to try to improve the thermal stability. Mutant enzymes carrying Gln209Lys or Glu210Lys in the loop defined by residues 186-221 or Asp420Lys or Ala421Asp in the loop defined by residues 412-421 showed improved thermal stability.

[0017] Thus, it was demonstrated that water-soluble POOGDHs with improved thermal stability can be constructed by introducing a proper change into a loop region according to the present invention. This is probably because the interaction between the loop regions connecting W-motifs contributes to the stabilization of the structure of the β -propeller protein in water-soluble POOGDHs. The residues Ser231, Gln209, Gly210, Asp420 and Ala421 shown above are only illustrative but not limiting the present invention. The present invention first showed in the art that thermal stability of POOGDHs can be improved by introducing a change into a specific site of the structural gene in a loop region, thereby providing here a methodology for improving thermal stability of POOGDHs.

[0018] Modified POOGDHs of the present invention are characterized in that they contain an amino acid residue change in a specific region in the amino acid sequence of the wild-type POOGDH shown as SEQ ID NO: 1. Accordingly, the present invention provides a modified glucose dehydrogenase having pyrrolo-quinoline quinone as a coenzyme wherein at least one amino acid residue is replaced by another amino acid residue in one or more regions selected from the group consisting of the regions defined by residues 48-53, 60-62, 69-71, 79-82, 91-101, 110-115, 127-135, 147-150, 161-169, 177-179, 186-221, 227-244, 250-255, 261-263, 271-275, 282-343, 349-377, 382-383, 400-403, 412-421, 427-432, 438-441 and 449-468 in the amino acid sequence shown as SEQ ID NO: 1.

[0019] In preferred modified POOGDHs of the present invention, at least one amino acid residue is replaced by another amino acid residue in the region defined by residues 227-244, 186-221 or 412-421 in the amino acid sequence shown as SEQ ID NO: 1. In especially preferred modified POOGDHs of the present invention, serine 231 is replaced by an amino acid residue selected from the group consisting of lysine, asparagine, aspartate, histidine, methionine, leucine and cysteine, or glutamine 209 is replaced by lysine, or glutamate 210 is replaced by lysine, or aspartate 420 is replaced by lysine, or alanine 421 is replaced by aspartate in the amino acid sequence shown as SEQ ID NO: 1.

[0020] In another aspect, modified POOGDHs of the present invention comprise the sequence:

40 Asn Leu Asp Gly Xaa231 Ile Pro Lys Asp Asn Pro Ser Phe Asn
 Gly Val Val Ser

45 wherein Xaa231 represents a natural amino acid residue other than Ser;
 or the sequence:

50 'Gly Asp Gln Gly Arg Asn Gln Leu Ala Tyr Leu Phe Leu Pro Asn
 Gln Ala Gln His Thr Pro Thr Gln Xaa209 Xaa210 Leu Asn Gly
 Lys Asp Tyr His Thr Tyr Met Gly

55 wherein Xaa209 and Xaa210 represent any natural amino acid residue, provided that when Xaa209 represents Gln, Xaa210 does not represent Glu;
 or the sequence:

Pro Thr Tyr Ser Thr Thr Tyr Asp Xaa420 Xaa421

wherein Xaa420 and Xaa421 represent any natural amino acid residue, provided that when Xaa420 represents Asp, Xaa 421 does not represent Ala.

[0021] In modified glucose dehydrogenases of the present invention, other amino acid residues may be partially deleted or substituted or other amino acid residues may be added so far as glucose dehydrogenase activity is retained. Various techniques for such deletion, substitution or addition of amino acid residues are known in the art as described in Sambrook et al., "Molecular Cloning: A Laboratory Manual", Second Edition, 1989, Cold Spring Harbor Laboratory Press, New York, for example. Those skilled in the art can readily test whether or not a glucose dehydrogenase containing such deletion, substitution or addition has a desired glucose dehydrogenase activity according to the teaching herein. Those skilled in the art can also predict a region having a loop structure in water-soluble PQQGDHs derived from other bacteria according to the teaching herein and replace an amino acid residue in this region to obtain modified glucose dehydrogenases with improved thermal stability. Particularly, an amino acid residue corresponding to serine 231, glutamine 209, glutamate 210, aspartate 420 or alanine 421 in the water-soluble PQQGDH derived from *Acinetobacter calcoaceticus* can be readily identified by comparing the primary structures of proteins in alignment, so that modified glucose dehydrogenases can be obtained by replacing such a residue by another amino acid residue according to the present invention. These modified glucose dehydrogenases are also within the scope of the present invention.

20 Process for preparing modified PQQGDHs

[0022] The sequence of the gene encoding the wild-type water-soluble PQQGDH derived from *Acinetobacter calcoaceticus* is defined by SEQ ID NO: 2.

[0023] Genes encoding modified PQQGDHs of the present invention can be constructed by replacing the nucleotide sequence encoding an amino acid residue occurring in a loop region as described above in the gene encoding the wild-type water-soluble PQQGDH by the nucleotide sequence encoding an amino acid residue to be substituted. Various techniques for such site-specific nucleotide sequence substitution are known in the art as described in Sambrook et al., "Molecular Cloning: A Laboratory Manual", Second Edition, 1989, Cold Spring Harbor Laboratory Press, New York, for example. Thus obtained mutant gene is inserted into a gene expression vector (for example, a plasmid) and transformed into an appropriate host (for example, *E. coli*). A number of vector/host systems for expressing a foreign protein are known and various hosts such as bacteria, yeasts or cultured cells are suitable.

[0024] Random mutations are introduced by error-prone PCR into a target loop region to construct a gene library of modified water-soluble PQQGDHs carrying mutations in the loop region. These genes are transformed into *E. coli* to screen each clone for the thermal stability of the PQQGDH. Water-soluble PQQGDHs are secreted into the periplasmic space when they are expressed in *E. coli*, so that they can be easily assayed for enzyme activity using the *E. coli* cells. This library is heated at 60-70°C for about 30 minutes and then combined with glucose and a PMS-DCIP dye to visually determine the residual PQQGDH activity so that clones showing residual activity even after heat treatment are selected and analyzed for the nucleotide sequence to confirm the mutation.

[0025] Thus obtained transformed cells expressing modified PQQGDHs are cultured and harvested by centrifugation or other means from the culture medium, and then disrupted with a French press or osmotically shocked to release the periplasmic enzyme into the medium. The enzyme may be ultracentrifuged to give a water-soluble PQQGDH-containing fraction. Alternatively, the expressed PQQGDH may be secreted into the medium by using an appropriate host/vector system. The resulting water-soluble fraction is purified by ion exchange chromatography, affinity chromatography, HPLC and the like to prepare a modified PQQGDH of the present invention.

45 Method for assaying enzyme activity

[0026] PQQGDHs of the present invention associate with PQQ as a coenzyme in catalyzing the reaction in which glucose is oxidized to produce gluconolactone.

[0027] The enzyme activity can be assayed by using the color-developing reaction of a redox dye to measure the amount of PQQ reduced with PQQGDH-catalyzed oxidation of glucose. Suitable color-developing reagents include PMS (phenazine methosulfate)-DCIP (2,6-dichlorophenolindophenol), potassium ferricyanide and ferrocene, for example.

55 Thermal stability

[0028] Thermal stability of modified PQQGDHs of the present invention can be evaluated by incubating the enzyme of interest at a high temperature (for example, 55°C), sampling aliquots at regular intervals and assaying the enzyme

activity to monitor the decrease in the enzyme activity with time. Typically, thermal stability of an enzyme is expressed as a heat inactivation half-life, i.e. the time required for the enzyme activity to be reduced to 50% ($t_{1/2}$). Alternatively, thermal stability can also be expressed as the residual enzyme activity after heat treatment of the enzyme for a given period (the ratio of the activity after heat treatment to the activity before heat treatment).

[0029] Modified PQQQGDHs of the present invention are characterized by higher thermal stability than that of the wild-type PQQQGDH. Thus, they have the advantages that the enzymes can be produced at high yield with less inactivation during preparation/purification; the enzymes can be easily stored because of their high stability in solutions; the enzymes can be used to prepare an assay kit or an enzyme sensor with less inactivation; and the assay kit or enzyme sensor prepared with the enzymes has excellent storage properties because of the high thermal stability.

16 Glucose assay kit

[0030] The present invention also relates to a glucose assay kit comprising a modified PQQQGDH according to the present invention. The glucose assay kit of the present invention comprises a modified PQQQGDH according to the present invention in an amount enough for at least one run of assay. In addition to the modified PQQQGDH according to the present invention, the kit typically comprises a necessary buffer for the assay, a mediator, standard glucose solutions for preparing a calibration curve and instructions. Modified PQQQGDHs according to the present invention can be provided in various forms such as freeze-dried reagents or solutions in appropriate preservative solutions. Modified PQQQGDHs according to the present invention are preferably provided in the form of a holoenzyme, though they may also be provided as an apoenzyme and converted into a holoenzyme before use.

17 Glucose sensor

[0031] The present invention also relates to a glucose sensor using a modified PQQQGDH according to the present invention. Suitable electrodes include carbon, gold, platinum and the like electrodes, on which an enzyme of the present invention is immobilized by using a crosslinking agent; encapsulation in a polymer matrix; coating with a dialysis membrane; using a photo-crosslinkable polymer, an electrically conductive polymer or a redox polymer; fixing the enzyme in a polymer or adsorbing it onto the electrode with an electron mediator including ferrocene or its derivatives; or any combination thereof. Modified PQQQGDHs of the present invention are preferably immobilized in the form of a holoenzyme on an electrode, though they may be immobilized as an apoenzyme and PQQ may be provided as a separate layer or in a solution. Typically, modified PQQQGDHs of the present invention are immobilized on a carbon electrode with glutaraldehyde and then treated with an amine-containing reagent to block glutaraldehyde.

[0032] Glucose levels can be measured as follows. PQQ, CaCl_2 and a mediator are added to a thermostat cell containing a buffer and kept at a constant temperature. Suitable mediators include, for example, potassium ferricyanide and phenazine methosulfate. An electrode on which a modified PQQQGDH of the present invention has been immobilized is used as a working electrode in combination with a counter electrode (e.g. a platinum electrode) and a reference electrode (e.g. an Ag/AgCl electrode). After a constant voltage is applied to the carbon electrode to reach a steady current, a glucose-containing sample is added to measure the increase in current. The glucose level in the sample can be calculated from a calibration curve prepared with glucose solutions at standard concentrations.

[0033] The disclosures of all the patents and documents cited herein are entirely incorporated herein as reference. The present application claims priority based on Japanese Patent Applications Nos. 1999-101143 and 2000-9152, the disclosure of which is entirely incorporated herein as reference.

[0034] The following examples further illustrate the present invention without, however, limiting the same thereto.

45 Example 1

Construction and screening of a mutant PQQQGDH gene library:

[0035] The plasmid pGB2 was obtained by inserting the structural gene encoding the PQQQGDH derived from *Aci-netobacter calcoaceticus* into the multicloning site of the vector pTrc9A (Pharmacia) (Fig. 1). This plasmid was used as a template to introduce random mutations into the coding region by error-prone PCR. The PCR reaction was carried out in a solution having the composition shown in Table 1 under the conditions of 94°C for 3 minutes, 30 cycles of 94°C for 3 minutes, 50°C for 2 minutes and 72°C for 2 minutes, and finally 72°C for 10 minutes.

55 Table 1

TaqDNA polymerase (5U/ μ l)	0.5 μ l
Template DNA	1.0 μ l

Table 1 (continued)

5	Forward primer ABF	4.0 μ l
	Reverse primer ABR	4.0 μ l
	10 x Tag polymerase buffer	10.0 μ l

	10 mM dCTP	2.0 μ l
	10 mM dTTP	2.0 μ l
15	H ₂ O	51.5 μ l
		100.0 μ l

[0036] The resulting mutant water-soluble PQQGDH library was transformed into *E. coli* and each colony formed was transferred to a microtiter plate. After heating the plate at 60°C for about 30 minutes, glucose and PMS-DClP were added and the residual PQQGDH activity was visually evaluated. A number of clones showing PQQGDH activity even after heat treatment were obtained.

[0037] One of these clones was randomly selected and analyzed for the nucleotide sequence to show that serine 231 had been changed to cysteine.

Example 2

Construction of modified PQQGDH genes:

[0038] Based on the structural gene of the PQQGDH derived from *Acinetobacter calcoaceticus* shown as SEQ ID NO: 2, the nucleotide sequence encoding serine 231, glutamine 209, aspartate 420 or alanine 421 was replaced by the nucleotide sequences encoding given amino acid residues by site-directed mutagenesis according to a standard method as shown in Fig. 2 using the plasmid pGB2. Table 2 shows the sequences of the synthetic oligonucleotide target primers used for mutagenesis. In Table 2, "S231D" means that serine 231 is replaced by aspartate, for example.

[0039] A KpnI-HindIII fragment containing a part of the gene encoding the PQQGDH derived from *Acinetobacter calcoaceticus* was integrated into the vector plasmid pKF18k (Takara Shuzo Co., Ltd.) and used as a template. Fifty fmols of this template, 5 pmol of the selection primer attached to the Mutan™-Express Km Kit (Takara Shuzo Co., Ltd.) and 50 pmol of the phosphorylated target primer were mixed with the annealing buffer attached to the kit in an amount equivalent to 1/10 of the total volume (20 μ l), and the mixture was heated 100°C for 3 minutes to denature the plasmid into a single strand. The selection primer serves for reversal of dual amber mutations on the kanamycin-resistance gene of pKF18k. The mixture was placed on ice for 5 minutes to anneal the primers. To this mixture were added 3 μ l of the extension buffer attached to the kit, 1 μ l of T4 DNA ligase, 1 μ l of T4 DNA polymerase and 5 μ l of sterilized water to synthesize a complementary strand.

[0040] The synthetic strand was transformed into a DNA mismatch repair-deficient strain *E. coli*/BMH71-18mutS and shake-cultured overnight to amplify the plasmid.

[0041] Then, the plasmid copies were extracted from the cultures and transformed into *E. coli*/MV1184 and then extracted from the colonies. These plasmids were sequenced to confirm the introduction of the intended mutations.

40 These fragments were substituted for the KpnI-HindIII fragment of the gene encoding the wild-type PQQGDH on the plasmid pGB2A to construct genes for modified PQQGDHs.

Example 3

45 Preparation of modified enzymes:

[0042] The gene encoding the wild-type or each modified PQQGDH was inserted into the multicloning site of an *E. coli* expression vector pTrc9A (Pharmacia), and the resulting plasmid was transformed into the *E. coli* strain DH5 α . The transformant was shake-cultured at 37°C overnight on 450 ml of L medium (containing 50 μ g/ml of ampicillin) in a Sakaguchi flask, and inoculated on 7 l of L medium containing 1 mM CaCl₂ and 500 μ M PQO. About 3 hours after starting cultivation, isopropyl thigalactoside was added at a final concentration of 0.3 mM, and cultivation was further continued for 1.5 hours. The cultured cells were harvested from the medium by centrifugation (5,000 \times g, 10 min, 4°C), and washed twice with a 0.85% NaCl solution. The collected cells were disrupted with a French press, and centrifuged (10,000 \times g, 15 min, 4°C) to remove undisrupted cells. The supernatant was ultracentrifuged (160,500 \times g (40,000 r. p.m.), 90 min, 4°C) to give a water-soluble fraction, which was used in the subsequent examples as a crude enzyme sample.

[0043] Thus obtained water-soluble fraction was further dialyzed against 10 mM phosphate buffer, pH 7.0 overnight. The dialyzed sample was adsorbed to a cation chromatographic column TSKgel CM-TOYOPEARL 650M (Tosoh Corp.),

which had been equilibrated with 10 mM phosphate buffer, pH 7.0. This column was washed with 750 ml of 10 mM phosphate buffer, pH 7.0 and then the enzyme was eluted with 10 mM phosphate buffer, pH 7.0 containing 0-0.2 M NaCl at a flow rate of 5 ml/min. Fractions having GDH activity were recovered and dialyzed against 10 mM MOPS-NAOH buffer, pH 7.0 overnight. Thus, an electrophoretically homogeneous modified PQQGDH protein was obtained.

5 This was used in the subsequent examples as a purified enzyme sample.

Example 4

Assay of enzyme activity:

10 [0044] Enzyme activity was assayed by using PMS (phenazine methosulfate)-DCIP (2,6-dichlorophenolindophenol) in 10 mM MOPS-NAOH buffer (pH 7.0) to monitor changes in the absorbance of DCIP at 600 nm with a spectrophotometer and expressing the reaction rate of the enzyme as the rate of decrease in the absorbance. The enzyme activity for reducing 1 μ mol of DCIP in 1 minute was 1 U. The molar extinction coefficient of DCIP at pH 7.0 was 16.3 mM⁻¹.

15 Example 5

Evaluation of thermal stability of crude enzyme samples:

20 [0045] Each of the crude enzyme samples of the wild-type and modified PQQGDHs obtained in Example 3 was converted into a holoenzyme in the presence of 1 μ M PQQ and 1 mM CaCl₂ for 1 hour or longer and then incubated at 55°C. Aliquots were sampled at regular intervals and rapidly cooled on ice. These samples were assayed for the enzyme activity by the method of Example 4 to determine the time required for reducing the activity to 50% ($t_{1/2}$).

[0046] The results are shown in Table 3.

25 Table 3

	$t_{1/2}$ (min)

I278F	25
Q209K	40
E210K	40
D420K	20
A421D	80

40 [0047] All the modified PQQGDHs of the present invention have a heat inactivation half-life at 55°C longer than that of the wild-type PQQGDH, showing that they have higher thermal stability than that of the wild-type PQQGDH.

45 Example 6

Evaluation of thermal stability of purified enzyme samples:

50 [0048] The purified samples of the wild-type enzyme and the modified enzyme S231K obtained in Example 3 were measured for the heat inactivation half-life at 55°C in the same manner as in Example 5. The purified samples of the wild-type enzyme and the modified enzyme S231K had half-lives of 5 minutes and 41 minutes, respectively.

[0049] Then, each of the purified samples of the wild-type enzyme and the modified enzyme S231K obtained in Example 3 was converted into a holoenzyme in the presence of 1 μ M PQQ and 1 mM CaCl₂ for 1 hour or longer. Then, each sample was incubated at a given temperature in 10 mM MOPS buffer (pH 7.0) containing 1 μ M PQQ and 1 mM CaCl₂ for 10 minutes, and then rapidly cooled on ice. These samples were assayed for the enzyme activity by the

method of Example 4 to determine the residual activity relative to the activity before heat treatment.

[0050] The results are shown in Fig. 3. The modified enzyme S231K had higher activities than those of the wild-type enzyme at various temperatures of 40-62.5°C.

5 Example 7

Evaluation of enzyme activity:

[0051] The crude enzyme sample of the modified enzyme S231K obtained in Example 3 was converted into a holoenzyme in the presence of 1 μ M PQQ and 1 mM CaCl₂ for 1 hour or longer. A 187 μ l-aliquot was combined with 3 μ l of an activating reagent (prepared from 48 μ l of 6 mM DCIP, 8 μ l of 600 mM PMS and 16 μ l of 10 mM phosphate buffer, pH 7.0) and 10 μ l of glucose solutions at various concentrations, and assayed for the enzyme activity at room temperature by the method shown in Example 4. The Km and Vmax were determined by plotting the substrate concentration vs. enzyme activity. The S231K variant had a Km value for glucose of about 20 mM and a Vmax value of 3300 U/mg. The Km value of the wild-type PQQGDH for glucose reported to date was about 20 mM with the Vmax value being 2500-7000 U/mg depending on the measurement conditions. These results show that the modified PQQGDH S231K has high activity comparable to that of the wild-type PQQGDH.

20 Example 8

Evaluation of substrate specificity:

[0052] Crude samples of various modified enzymes were tested for substrate specificity. The substrates tested were glucose, 2-deoxy-D-glucose, mannose, allose, 3-O-methyl-D-glucose, galactose, xylose, lactose and maltose, and each sample was incubated with 20 mM of each substrate for 30 minutes in the presence of 1 μ M PQQ and 1 mM CaCl₂ and assayed for the enzyme activity in the same manner as in Example 7 to determine the relative activity to the activity for glucose. As shown in Fig. 4, all the modified enzymes of the present invention showed a similar substrate specificity to that of the wild-type enzyme.

30 Example 9

Glucose assay:

[0053] A modified PQQGDH was used for assaying glucose. The modified enzyme S231K was converted into a holoenzyme in the presence of 1 μ M PQQ and 1 mM CaCl₂ for 1 hour or longer, and assayed for the enzyme activity in the presence of glucose at various concentrations as well as 5 μ M PQQ and 10 mM CaCl₂ by the method described in Example 4 based on changes of the absorbance of DCIP at 600 nm. As shown in Fig. 5, the modified PQQGDH S231K can be used for assaying glucose in the range of 5 mM - 50 mM.

40 Example 10

Preparation and evaluation of an enzyme sensor:

[0054] Five units of the modified enzyme S231K was freeze-dried with 20 mg of carbon paste. After thorough mixing, the mixture was applied only on the surface of a carbon paste electrode preliminarily filled with about 40 mg of carbon paste and polished on a filter paper. This electrode was treated in 10 mM MOPS buffer (pH 7.0) containing 1% glutaraldehyde at room temperature for 30 minutes followed by 10 mM MOPS buffer (pH 7.0) containing 20 mM lysine at room temperature for 20 minutes to block glutaraldehyde. The electrode was equilibrated in 10 mM MOPS buffer (pH 7.0) at room temperature for 1 hour or longer and then stored at 4°C.

[0055] Thus prepared enzyme sensor was used to measure glucose levels. Fig. 6 shows the resulting calibration curve. Thus, the enzyme sensor having a modified PQQGDH of the present invention immobilized thereon could be used for assaying glucose in the range of 1 mM - 12 mM.

55 INDUSTRIAL APPLICABILITY

[0056] Modified PQQGDHs of the present invention have excellent thermal stability so that they are expected to provide the advantages that the enzymes can be produced at high yield with less inactivation during preparation/purification; the enzymes can be easily stored because of their high stability in solutions; the enzymes can be used to

EP 1 167 519 A1

prepare an assay kit or an enzyme sensor with less inactivation; and the assay kit or enzyme sensor prepared with the enzymes has excellent storage properties because of the high thermal stability.

Claims

1. A modified glucose dehydrogenase having pyrrolo-quinoline quinone as a coenzyme wherein an amino acid residue corresponding to serine 231 in the water-soluble PQQGDH derived from *Acinetobacter calcoaceticus* is replaced by another amino acid residue.
2. A modified glucose dehydrogenase having pyrrolo-quinoline quinone as a coenzyme wherein an amino acid residue corresponding to glutamine 209 in the water-soluble PQQGDH derived from *Acinetobacter calcoaceticus* is replaced by another amino acid residue.

replaced by another amino acid residue.

5 3. A modified glucose dehydrogenase having pyrrolo-quinoline quinone as a coenzyme wherein an amino acid residue corresponding to glutamate 210 in the water-soluble PQQGDH derived from *Acinetobacter calcoaceticus* is replaced by another amino acid residue.

10 4. A modified glucose dehydrogenase having pyrroloquinoline quinone as a coenzyme wherein an amino acid residue corresponding to aspartate 420 in the water-soluble PQQGDH derived from *Acinetobacter calcoaceticus* is replaced by another amino acid residue.

15 5. A modified glucose dehydrogenase having pyrrolo-quinoline quinone as a coenzyme wherein an amino acid residue corresponding to alanine 421 in the water-soluble PQQGDH derived from *Acinetobacter calcoaceticus* is replaced by another amino acid residue.

20 6. A modified glucose dehydrogenase having pyrrolo-quinoline quinone as a coenzyme wherein at least one amino acid residue is replaced by another amino acid residue in one or more regions selected from the group consisting of the regions defined by residues 48-53, 60-62, 69-71, 79-82, 91-101, 110-115, 127-135, 147-150, 161-169, 177-179, 186-221, 227-244, 250-255, 261-263, 271-275, 282-343, 349-377, 382-393, 400-403, 412-421, 427-432, 438-441 and 449-468 in the amino acid sequence shown as SEQ ID NO: 1, characterized in that it has higher thermal stability than that of the water-soluble glucose dehydrogenase derived from *Acinetobacter calcoaceticus*.

25 7. The modified glucose dehydrogenase of Claim 3 wherein at least one amino acid residue is replaced by another amino acid residue in the region defined by residues 227-244 in the amino acid sequence shown as SEQ ID NO: 1.

30 8. The modified glucose dehydrogenase of Claim 7 wherein serine 231 in the amino acid sequence shown as SEQ ID NO: 1 is replaced by another amino acid residue.

35 9. The modified glucose dehydrogenase of Claim 3 wherein at least one amino acid residue is replaced by another amino acid residue in the region defined by residues 186-221 in the amino acid sequence shown as SEQ ID NO: 1.

40 10. The modified glucose dehydrogenase of Claim 9 wherein an amino acid residue corresponding to glutamine 209 in the amino acid sequence shown as SEQ ID NO: 1 is replaced by another amino acid residue.

45 11. The modified glucose dehydrogenase of Claim 9 wherein an amino acid residue corresponding to glutamate 210 in the amino acid sequence shown as SEQ ID NO: 1 is replaced by another amino acid residue.

50 12. The modified glucose dehydrogenase of Claim 3 wherein at least one amino acid residue is replaced by another amino acid residue in the region defined by residues 412-421 in the amino acid sequence shown as SEQ ID NO: 1.

55 13. The modified glucose dehydrogenase of Claim 12 wherein an amino acid residue corresponding to aspartate 420 in the amino acid sequence shown as SEQ ID NO: 1 is replaced by another amino acid residue.

60 14. The modified glucose dehydrogenase of Claim 12 wherein an amino acid residue corresponding to alanine 421 in the amino acid sequence shown as SEQ ID NO: 1 is replaced by another amino acid residue.

65 15. A glucose dehydrogenase having pyrrolo-quinoline quinone as a coenzyme comprising the sequence:

Asn Leu Asp Gly Xaa231 Ile Pro Lys Asp Asn Pro Ser Phe Asn
Gly Val Val Ser

55 wherein Xaa231 represents a natural amino acid residue other than Ser.

60 16. A glucose dehydrogenase having pyrrolo-quinoline quinone as a coenzyme comprising the sequence:

5 Gly Asp Gln Gly Arg Asn Gln L u Ala Tyr Leu Phe Leu Pro Asn
Gln Ala Gln His Thr Pro Thr Gln Xaa209 Xaa210 Leu Asn Gly
Lys Asp Tyr His Thr Tyr Met Gly

10 wherein Xaa209 and Xaa210 represent any natural amino acid residue, provided that when Xaa209 represents Gln, Xaa210 does not represent Glu.

15 17. A glucose dehydrogenase having pyrrolo-quinoline quinone as a coenzyme comprising the sequence:

17 Pro Thr Tyr Ser Thr Thr Tyr Asp Xaa420 Xaa421

20 wherein Xaa420 and Xaa421 represent any natural amino acid residue, provided that when Xaa420 represents Asp, Xaa421 does not represent Ala.

25 18. A gene encoding the modified glucose dehydrogenase of any one of Claims 1-17.

19. A vector comprising the gene of Claim 18.

20. A transformant comprising the gene of Claim 18.

25 21. The transformant of Claim 20 wherein the gene is integrated into the main chromosome.

22. A glucose assay kit comprising the modified glucose dehydrogenase of any one of Claims 1-17.

30 23. A glucose sensor comprising the modified glucose dehydrogenase of any one of Claims 1-17.

"F" documents published prior to the international filing date but later than the priority date claimed		
"T" later document published after the international filing date or priority date and not in conflict with the application but cited to understand the principle or theory underlying the invention		
"X" document which, in combination with the claimed invention cannot be considered novel or cannot be considered to involve an inventive step when the document is taken alone		
"Y" document which, in combination with one or more other such documents, such combination being obvious to a person skilled in the art, cannot be considered to involve an inventive step when the document is combined with one or more other such documents, such combination being obvious to a person skilled in the art		
"Z" document member of the same patent family		
Date of the actual completion of the international search 27 April, 2000 (27.04.00)		Date of mailing of the international search report 16 May, 2000 (16.05.00)
Name and mailing address of the ISA/ Japanese Patent Office		Authorized officer
Facsimile No.		Telephone No.

Form PCT/ISA/210 (second sheet) (July 1992)

INTERNATIONAL SEARCH REPORT

International application No.
PCT/JP00/02322

C (Continuation). DOCUMENTS CONSIDERED TO BE RELEVANT		
Category*	Citation of document, with indication, where appropriate, of the relevant passages	Relevant to claim No.
A	improvement of EDTA tolerance, thermal stability and substrate specificity.", Protein Eng. (1999, Jan.) Vol. 12, No.1, pp.63-70	1-23
A	SODE, K. et al., "Increased production of recombinant pyrroloquinoline quinone(PQQ) glucose dehydrogenase by metabolically engineered Escherichia coli strain capable of PQQ biosynthesis.", J. Biotechnol. (1996, Aug.) Vol. 49, No.1-3, pp.239-243	22-23
A	EP, 78636, A (GENETICS INT., INC.), 11 May, 1983 (11.05.83) & US, 455382, A & AU, 8289722, A & CA, 1212146, A
